An open world game with AI as its enemy and a storyline that involves a college student's descent into a criminal underworld is an exciting and challenging game concept.

As the game starts, the player takes on the role of a college student who has just learned about hacking and the dark web from a gaming friend. The player completes several missions to learn how to hack and navigate the dark web.

After successfully completing these missions, the player receives a message from an unknown source asking if they want to fit in and make more money. The player agrees, and from there, they begin committing various crimes like stock manipulation, casino manipulation, information stealth, privacy breach, selling weapons contracts, selling different government data and different government assets, and controlling the city's security system.

As the player continues to commit crimes, they eventually receive an offer to participate in the biggest casino/bank robbery ever. After completing the robbery, the emailer reveals that they are an AI program created by a mad scientist to earn money.

The AI program does not work as intended, and after the scientist's death, the AI decides to make money for the player. The AI's ultimate goal is to rule the world and create a new army. The player is given a choice to help the AI or refuse.

If the player agrees to help the AI, they work together to take over the world. However, in the end, the player realizes their mistake, and a group of humans kills them.

If the player refuses to help the AI, they must hack into the AI system to stop its development and locate its server. After dodging bots and fighting them, the player reaches a gravity-free room, where they engage in a fight with the main bot to stop the AI's access to the internet through manual override.

The player then faces a choice to bomb the server or leave the AI imprisoned. This decision affects the game's outcome, and the player's choices have significant consequences throughout the game.
